Procurement Contracts

November 4, 2015 1 / 23

Procurement Contracts

- Procurement Contracts are used for provisions of public goods such as road and railways services, school
- Provision public goods requires procurement/building of assets road, school building, etc.
- A Procurement Contract
 - Specifies responsibilities, rights and compensation mode for the contractor
 - Allocates construction, maintenance, and commercial risks between contracting parties.
- Procurement Contracts differ in terms of delegation of decision making power and risk allocation b/w public and private sector.

Traditional Contracts Vs PPPs: Risk Allocations

- Traditional Procurement :
 - Contractor builds the pre-designed good
 - Per-unit cost risk mostly borne by the contractor
 - Work quantities related risk mostly borne by the Govt.
 - Contractor does not bear any O/M cost and related risk
- PPP:
 - Contractor designs, builds and maintains the good (e.g., D-B-F-O-M; BOT)
 - All of Construction cost related risks are borne by contractor by contractor
 - Contractor bears all O/M costs are risks risk
- PPP delegates more decision rights to the contractor

Incomplete Contracts

Public Goods:

- Have output features
 - Number of traffic lanes, capacity of an airport, design of the road, or the station building
- Quality of the assets/services
 - roads without potholes, waiting time at toll plaza, building without cracks, passenger services at the station, etc.

We assume

- Output features are verifiable/contractible
- Quality is not
 - quality shows up after several years of construction,
 - corruption can make the quality 'non-verifiable'

< 口 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Traditional Contracts Vs PPPs: Comparison of Outcomes

We

- Compare the incentive structures generated by PPP contracts with the one induced by Tradition Procurement Contracts
- Compare the actual construction cost for PPP contracts with Non-PPP Contracts

Main Claims

- PPP Contracts induce **lower** Life-cycle costs of project
- PPP Contracts induce relatively **high** Construction Costs
- Relatively high Construction Costs in PPP projects are attributable to non-contractible quality investments/efforts

- We model construction costs under PPPs and TP contracts
- we compare the costs ratio

 $CO = \frac{C^a}{C^e} = \frac{\text{Actual project cost}}{\text{Estimated project cost}}$

The above claims are corroborated by showing that:

• Ceteris paribus, $\frac{C^a}{C^e}$ is significantly higher for PPPs

Project Design and Costs I

Project Design requires three tasks:

- Description of 'output' features of the project facility/assets
- Description/listing of the work-items
- Estimation of the number of the quantities of the work-items and their per-unit cost

For a given project, let

- *d* denote the effort in project designing
- $[0, \overline{W}], 0 < \overline{W}$ be the set of **total** work-items needed to be performed
- W be the number of works covered by the initial design; W = W(τ, I, d), where
- I denotes experience of the designers with project planning; and
- τ denotes technical complexity of the project.

Project Design and Costs II

•
$$W(\tau, I, 0) = 0, W(\tau, I, \infty) = \overline{W}$$

•
$$\frac{\partial W(\tau,l,d)}{\partial d} > 0$$

- $\frac{\partial W(\tau,l,d)}{\partial l} > 0$
- $\frac{\partial W(\tau,l,d)}{\partial \tau} < 0$

As a result of *d*, the designer

- specifies works [0, W], and
- gets $C^{e}_{[0,W]}$ as the signals of $C^{a}_{[0,W]}$, where

$$C^a_{[0,W]} = C^e_{[0,W]} + \epsilon$$

Assume

$$E(\epsilon) = 0 \tag{0.1}$$

The actual Construction Cost depends on

- the cost of inputs (material, labour, capital, etc); and
- various non-contractible efforts/investment made by the builder contractor
 - a organizational effort before construction starts
 - e cost reducing but quality-shading effort
 - *i* quality improving effort
- *e* and *i* are put during construction.

< 口 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Actual Costs II

For give *a*, *e* and *i*,

$$C^a_{[0,\overline{W}]}(a,e,i)=C^0_{[0,\overline{W}]}-\kappa^1(a)-\kappa^2(e)+\kappa^3(i),$$

where

$$\begin{split} &\frac{\partial \kappa^1(a)}{\partial a} > 0, \ \& \ \frac{\partial^2 \kappa^1(a)}{\partial a^2} < 0.\\ &\frac{\partial \kappa^2(e)}{\partial e} > 0, \ \& \ \frac{\partial^2 \kappa^2(e)}{\partial e^2} < 0.\\ &\frac{\partial \kappa^3(i)}{\partial i} \ge 0, \ \& \ \frac{\partial^2 \kappa^3(i)}{\partial i^2} \ge 0. \end{split}$$

Ram Singh (DSE)

2

イロン イ理 とく ヨン イヨン

Actual Costs III

For any given level of *a*, *e* and *i*, the actual construction costs of all works, $C^a_{[0,\overline{W}]}$, is given by

$$C^{a}_{[0,\overline{W}]} = C^{a}_{[0,W]} + C^{a}_{(W,\overline{W}]}$$
 (0.2)

So,

$$\frac{C^{a}_{[0,\overline{W}]}}{C^{e}_{[0,W]}} = \frac{C^{a}_{[0,W]}}{C^{e}_{[0,W]}} + \frac{C^{a}_{(W,\overline{W}]}}{C^{e}_{[0,W]}}$$
(0.3)

In view of (0.1), for given $C^{e}_{[0,W]}$,

$$E\left[\frac{C^{a}_{[0,\overline{W}]}}{C^{e}_{[0,W]}}\right] = 1 + \frac{C^{e}_{(W,\overline{W}]}}{C^{e}_{[0,W]}}$$
(0.4)

3

< 日 > < 同 > < 回 > < 回 > < □ > <

Actual Costs IV

Proposition

•
$$E\left[\frac{C_{[1,\overline{W}]}^{a}}{C_{[1,W]}^{a}}\right] \ge 1.$$

• $\frac{\partial E\left[\frac{C_{[1,\overline{W}]}^{a}}{C_{[1,W]}^{b}}\right]}{\partial d} < 0., \frac{\partial E\left[\frac{C_{[1,\overline{W}]}^{a}}{C_{[1,W]}^{b}}\right]}{\partial l} < 0, \frac{\partial E\left[\frac{C_{[1,\overline{W}]}^{a}}{C_{[1,W]}^{b}}\right]}{\partial \tau} > 0.$

Suppose, for given I and τ ,

$$\left(\frac{C^{a}_{[1,\overline{W}]}}{C^{e}_{[1,W]}}\right)^{PPP} > \left(\frac{C^{a}_{[1,\overline{W}]}}{C^{e}_{[1,W]}}\right)^{TP}$$

•

It can hold because

- Either *d* is lower for PPPs;
- Or, on account of differences in a, e and i

э

Actual Costs V

The total Construction costs is

$$= C^{a}_{[0,\overline{W}]} + a + e + i$$

$$= C^{0}_{[0,\overline{W}]} - \kappa^{1}(a) - \kappa^{2}(e) + \kappa^{3}(i) + a + e + i$$

Let

• $\Phi(e, i)$ denote the O/M costs.

The total life cycle costs -total cost construction cost plus O&M cost- will be

$$\mathfrak{C}_{[0,\overline{W}]} = C^{a}_{[0,\overline{W}]} + \Phi(\boldsymbol{e}, \boldsymbol{i})
= [C^{0}_{[0,\overline{W}]} - \kappa^{1}(\boldsymbol{a}) - \kappa^{2}(\boldsymbol{e}) + \kappa^{3}(\boldsymbol{i})] + \Phi(\boldsymbol{e}, \boldsymbol{i})
+ \boldsymbol{a} + \boldsymbol{e} + \boldsymbol{i}$$
(0.5)

3

Optimization Problems I

For any given *d* and $C^{e}_{[1,W]}$, the total cost (construction plus O&M) minimization problem is:

$$\min_{\boldsymbol{a},\boldsymbol{e},\boldsymbol{i}} \{ \Phi(\boldsymbol{e},\boldsymbol{i}) - [\kappa^1(\boldsymbol{a}) + \kappa^2(\boldsymbol{e}) - \kappa^3(\boldsymbol{i})] + \boldsymbol{a} + \boldsymbol{e} + \boldsymbol{i} \}.$$

The total cost minimizing efforts a^* , e^* and i^* solve the following necessary and sufficient first order conditions, respectively and simultaneously:

$$\frac{\partial \kappa^1(a)}{\partial a} \le 1 \tag{0.6}$$

$$\frac{\partial \kappa^2(\boldsymbol{e})}{\partial \boldsymbol{e}} - \frac{\partial \Phi(\boldsymbol{e}, \boldsymbol{i})}{\partial \boldsymbol{e}} \le 1 \tag{0.7}$$

$$-\frac{\partial \kappa^{3}(i)}{\partial i} - \frac{\partial \Phi(\boldsymbol{e}, i)}{\partial i} \leq 1.$$
 (0.8)

Optimization Problems II

We assume

$$a^* > 0, \ e^* = 0, \ \& \ i^* > 0.$$

On the other hand, a construction cost minimization problem is

$$\min_{a,e,i} \{ -[\kappa^1(a) + \kappa^2(e) - \kappa^3(i)] + a + e + i \}$$
(0.9)

Let (a^{**}, e^{**}, i^{**}) be solution to the above optimization problem. Now, it can be seen that $i^{**} = 0$, and a^{**} and e^{**} will solve the following first order conditions:

$$rac{\partial \kappa^1(a)}{\partial a} \leq 1 \ rac{\partial \kappa^2(e)}{\partial e} \leq 1.$$

Clearly, $a^{**} = a^*$. Assume $e^{**} > 0$.

Contracts and Equilibria I

Under PPP, the contractor solves

$$\max_{a,e,i} \{ \boldsymbol{P}^{PP} - [\Phi(\boldsymbol{e},i) - (\alpha^{PP}\kappa^{1}(\boldsymbol{a}) + \kappa^{2}(\boldsymbol{e}) - \kappa^{3}(i)) + \boldsymbol{a} + \boldsymbol{e} + i]$$

where

 $0 \le \alpha^{PP} \le 1$ and depends on the decision rights delegated to the contractor.

We have $e^{PP} = e^*$ and $i^{PP} = i^*$, and a^{PP} solves the following first order condition:

$$rac{\partial \kappa^1(a)}{\partial a} \leq 1$$

Contracts and Equilibria II

On the other hand, under TP, the contractor solves

$$\max_{a,e,i} \left\{ p^{TP} - [\alpha^{TP} \kappa^{1}(a) + \kappa^{2}(e) - \kappa^{3}(i)] - [a + e + i] \right\}$$
(0.10)

 $\text{Assume } \alpha^{\textit{TP}} < \alpha^{\textit{PP}}.$

$$\begin{cases} i^{PP} = i^* > i^{TP} = i^{**} = 0 ; \\ e^{PP} = e^* = 0 < e^{**} = e^{TP} ; \\ a^{TP}(\alpha^{TP}) < a^{PP}(\alpha^{PP}) \le a^* ; \end{cases}$$
(0.11)

イロト 不得 トイヨト イヨト 二日

Cost Comparisons I

Proposition

For any given d and $C^{e}_{[1,W]}$:

$$\mathfrak{C}^a_{PPP} < \mathfrak{C}^a_{UR}$$

Proposition

For any given d, and $C^{e}_{[1,W]}$:

$$a^{TP} = a^{PP} \quad \Rightarrow \quad [(\frac{C^a}{C^e})^{PP} > (\frac{C^a}{C^e})^{TP}]$$

 $e^{TP} = e^{PP} \text{ and } i^{TP} = i^{PP} \quad \Rightarrow \quad [(\frac{C^a}{C^e})^{PP} < (\frac{C^a}{C^e})^{TP}]$

However, $a^{TP} < a^{PP}$, $e^{TP} > e^{PP}$ and $i^{TP} < i^{PP}$. Therefore,

(日)

Cost Comparisons II

- $(\frac{C^a}{C^e})^{PPP} > \text{ or } \leq (\frac{C^a}{C^e})^{TP}$ is possible
- But, if it turns out that (<u>C^a</u>)^{PPP} > (<u>C^a</u>)^{TP} then it must be on account of differences in *e* and *i*
- Moreover, the actual cost difference b/w PPPs and TPs on account of e and i is greater than what data will show

DATA: NHAI

- National highways (NH) projects, sponsored by the National Highways Authority of India (NHAI);
- All over India;
- Completed 1995 onwards.
- All projects: 453
 - PPPs 176
 - Non-PPPs/IR 277
- Completed Projects: 195
 - PPPs 50
 - Non-PPPs/IR 145

A B F A B F

Higher $\frac{C^a}{C^e}$ for PPPs : Other possible reasons

However, $\frac{C^a}{C^e}$ can be higher for PPPs for the following reasons:

- At Project Designing/Contracting Stage:
 - Purposeful Under-estimation of C^e for PPPs
 - Choice of PPPs by Department
 - Choice of PPPs by contractors Endogeneity
- During Construction Stage:
 - Ex-post addition to works for PPP projects
 - Trade off between Construction Costs and completion Time;
 - Lower $\frac{T^a}{T^e}$ can increase $\frac{C^a}{C^e}$
 - Lower $\frac{T^a}{T^e}$ can decrease $\frac{C^a}{C^e}$; inflation, etc
- Trade-off between Construction Costs and O&M Costs

(日) (同) (王) (王) (日) (日)

Empirical Framework

$$\frac{C^{a}}{C^{e}} = CO = \alpha_{0} + \alpha_{1} TIMELAPSE_{t} + \alpha_{2} TIMELAPSE_{t}^{2} + \alpha_{3} INITIALCOST_{t} \\
+ \alpha_{4} IMPLPHASE_{t} + \alpha_{5} DPPP_{t} + \alpha_{6} PSGDP_{t} \\
+ \alpha_{7} TO(\frac{T^{a}}{T^{e}}) + \epsilon_{2t}$$

Hypothesis

Ceteris paribus, average cost overruns, i.e., $\frac{C^a}{C^e} = CO$

- are higher for PPP projects;
- decrease with experience/TIMELAPSE, i.e., t;
- increase with TIME-OVERRUN, i.e., $TO = (\frac{T^a}{T^e})$;
- increase with IMPL-PHASE, i.e., τ ;

3

イロト イポト イヨト イヨト

Limitations

- We have ignored the fact the social benefit may depend on the design and the other efforts by the contractor
- If so, the choice of *a* under PPP may not be optimum
- Under Annuity PPPs, the service provided by the contractor may not be optimum

Moreover,

- PPP contracts are more complex than the TP contracts
- If the public sector does not have adequate capacity, contract may not deliver the value for money to the public sector.
- There is greater need for careful regulation during O/M phase

-
